

REVENUE INTELLIGENCE · REVOPS / GTM ENGINEERING

Turning Stripe, HubSpot and ad data into a forecast you can **act on.**

A working, Stripe-first revenue forecast with pipeline, retention, cash and marketing analytics, an AI weekly brief, and a Claude connector.

Prepared by **Emil Pekkinen** · October 2026
Live demo: **hamina-revops-demo.vercel.app**

All customers, deals, payments and campaigns are synthetic.
Not an official Hamina document.

Lots of revenue data. **No bandwidth** to use it.

Stripe

Who actually pays. Subscriptions, invoices, failed and late payments. It's the most honest signal Hamina has, and it isn't used for forecasting.

HubSpot

Who is being sold to. Deals, stages, close dates. The forecast relies on stage percentages that nobody has checked against outcomes.

Ad platforms

What we spend to grow. Google, LinkedIn, Meta, YouTube, G2. Each reports its own conversions; none of it is tied to revenue.

Three systems with three versions of the truth. The questions the CRO, CFO and COO ask ("**Will we hit plan?**", "**Which deals are real?**", "**Is marketing working?**") need all three joined, modelled and kept fresh. That is a RevOps engineering job, not a spreadsheet.

One pipeline from raw data to decisions

Unify. Stripe ↔ HubSpot identity resolution (domain → contact email → fuzzy name). All 14 enterprise customers matched; 19 CRM companies already pay via self-serve.

Model. Renewal model, deal win/close-date model, marketing mix model. Everything is computed as of a date, so it can be backtested.

Deliver. Dashboard in Hamina's design system, AI weekly brief, and an MCP connector to ask Claude directly.

FORECAST

FY2026 forecast **€3.33M** vs a **€3.42M** plan

Monthly revenue: actuals and forecast

Cash revenue by month. Forecast from Oct 2026 with P10–P90 range.

› View as table

- ✓ **4,000 Monte Carlo runs** combine renewals, new self-serve, enterprise renewals, open deals and not-yet-created pipeline.
- ✓ FY2026 P10–P90 **€3.16M–€3.55M**: about a **29%** chance of hitting plan.
- ✓ FY2027 P50 **€5.86M** (+76%); ARR **€6.1M** by Dec 2027.
- ✓ A range instead of one number, so finance can plan for P10 and sales can push for P90.
- ✓ Today: ARR **€3.17M** (+66% YoY), NRR **84%**, cash next 90 days **€988k**.

ARR €3.2M → €6.1M: half of it still has to be sold

ARR bridge

Sep 2026 → Dec 2027 · expected values

ARR level Increase Decrease

> View as table

DRIVER (SEP 2026 → DEC 2027)	ARR
New self-serve customers	+€1.41M
New logos from deals not yet created	+€1.40M
New logos from today's open pipeline	+€0.64M
Enterprise renewal uplift	+€0.19M
Self-serve expansion	+€0.09M
Self-serve churn	-€0.54M
Enterprise churn	-€0.21M

Self-serve churn is the single biggest leak, at €0.54M of ARR. Every point of renewal rate is worth ~€21k of FY2027 revenue.

HubSpot says "Contract sent" = 80%. History says 27%.

STAGE	HUBSPOT	ACTUAL WIN RATE
Discovery	10%	8%
Qualified	20%	15%
Technical evaluation	40%	36%
Business case	60%	41%
Contract sent	80%	27%

- ✓ Deal model on rebuilt HubSpot history: **AUC 0.86**, Brier **0.11 vs 0.18** for stage %.
- ✓ Open pipeline €3.2M: HubSpot - weighted **€788k**, model-expected **€640k**.
- ✓ Won deals close **35 days** after the rep's date (median). Flags: pushed close dates, no activity, stuck in stage.

OPEN PIPELINE

€3.21M

24 open deals in HubSpot

HUBSPOT-WEIGHTED

€788k

Amount x stage probability, as reported in the CRM

MODEL-EXPECTED

€640k

▼ -19% vs HubSpot

Amount x modelled win probability. This is what the forecast uses.

CLOSE-DATE SLIP

35 days

Median delay of won deals vs the rep's close date. 4 open deals are already paying self-serve.

Open deals

Default sort: model-expected value. Δ pp = model win probability minus HubSpot stage probability.

Stripe sees churn **before** it happens

€988k expected in the next 90 days, week by week

Expected weekly cash inflows

13 weeks from 1 Oct 2026 to 24 Dec 2026. Whiskers show the P10-P90 range of the weekly total.

> View as table

NEXT 90 DAYS

€988k

P10-P90 €826k – €1.20M

OVERDUE RECEIVABLES

€88k

Grand Meridian Resorts, a new logo, 28 days late on €85k

Each open invoice gets an expected pay date from that customer's own payment history; renewals and new deals flow in from the same simulation.

Paid media drives **41%** of self-serve bookings, with a lag

PAID SPEND, LAST 12 MONTHS

€219k

6.6% of 2025 revenue · €430k since 2022

SELF-SERVE BOOKINGS FROM PAID

41%

€252k of first-invoice bookings ·
€1.15 per €1 before renewals

ENTERPRISE DEALS FROM PAID

71%

≈1.8 deals per €10k LinkedIn/search,
3 months later

AD → REVENUE LAG

0–1 / ~8 mo

Self-serve / enterprise (deal created
after 3 mo + 139-day cycle)

Spend by channel vs self-serve new bookings

Bars: monthly paid spend (left axis). Line: new self-serve bookings from Stripe (right axis); dashed: marketing mix model fit (R^2 0.76).

> View as table

- ✓ 6 platforms, 108 campaigns; paid ≈ **6–7% of revenue**, in line with B2B SaaS benchmarks.
- ✓ **Lag matters:** self-serve responds in 0–1 month; enterprise deals ~3 months later; revenue ~8 months.
- ✓ Marketing mix model: **€1.15** first-invoice bookings per €1 before renewals; carry-over half-life 1.6 months.
- ✓ Honest limit: channel-level credit needs holdout tests; platform-reported CPLs are not revenue.

What if we change the inputs?

Six levers, each sized by the Monte Carlo model. Examples for FY2027 revenue:

LEVER	IMPACT
Enterprise win rate +5 pp	+€0.56M
Paid marketing +20%	+€0.29M
Self-serve renewal +5 pp	+€0.10M
Average deal size +10%	+€0.19M

Board prep in minutes: "what do we need to believe" to hit a number, lever by lever.

Would it have been right? **Backtested**, not assumed.

Backtests: forecast range vs what happened

Cash revenue over the forecast horizon, for each historical as-of date.

■ P10-P90 — Forecast P50 ◆ Actual ○ Naive run-rate

- ✓ The model is re-run as of 5 past dates using **only data known then**, then compared with what happened.
- ✓ Average error **14%** vs **28%** for a naive run-rate; actuals inside the P10-P90 band **4 of 5** times.
- ✓ The miss (mid-2025, -37%) is shown, not tuned away: two large wins the pipeline underrated. That's the next model improvement.
- ✓ Component models: renewal **AUC 0.63** (Stripe signals only), deal **AUC 0.86**.

A weekly brief, and the whole model **inside Claude**

AI weekly brief

One click (or a Monday Slack post): headline vs plan, the 3–4 accounts to act on with an owner and the euros at stake, pipeline reality check, cash.

Act this week: Aurelia Grand Hotels: €115k renewal on 6 Oct, 57% likely. Elina to secure a signed renewal and payment commitment. ...

MCP connector for Claude

12 read-only tools (forecast, deals, accounts, renewals, cash, marketing, scenarios, model trust). Add one URL as a custom connector, then ask in plain language:

Where will FY2026 land vs plan, and which three accounts should Mia call this week?

What happens to FY2027 if we raise paid spend 30% and win rate 3 points?

Connector: hamina-revops-demo.vercel.app/api/mcp · Claude.ai / Desktop → Settings → Connectors → Add custom connector

One model, **every function** reads from it

■ Finance / CFO

- Forecast with ranges for budget and board
- 13-week cash view, overdue risk per payer
- Plan vs P50 gap visible months early

■ Sales / CRO

- Calibrated deal odds instead of stage %
- Slipping and stalled deals flagged weekly
- Paying self-serve accounts → expansion targets

■ Marketing

- Spend tied to bookings and pipeline, with lag
- Budget conversations in € of revenue, not CPL
- Clear next step: holdout tests per channel

■ RevOps / GTM

- Stripe ↔ HubSpot identity resolved
- Data-quality signals (missing domains, pushes)
- Write-back of scores into HubSpot

■ Customer success

- Renewal risk list with reasons, 180 days ahead
- Late-payment and failed-card early warnings
- Prioritise by ARR at risk

■ COO / company ops

- One shared number across teams
- Hiring and spend decisions from scenarios
- Less manual reporting: brief and Claude answer

What this looks like with **Hamina's real data**

30 Days 1–30: connect & validate

- Read-only Stripe, HubSpot, ad APIs into a warehouse
- Identity resolution on real accounts
- Reconcile revenue to the finance books

60 Days 31–60: models live

- Retrain deal and renewal models on real history
- Backtest; agree definitions with finance
- Weekly brief to Slack; Claude connector for the team

90 Days 61–90: close the loop

- Write deal and renewal scores into HubSpot
- Add product usage to the churn model
- First channel holdout test with marketing

The schemas in this demo mirror the **Stripe and HubSpot APIs**. Swapping the synthetic generators for API pulls is the only change needed to run on real data. Stack: Python, SQLite/DuckDB, scikit-learn, Next.js on Vercel.

TRY IT

Thank you.
